# Weekly Coal Production

Production for Week Ended:  
April 9, 1988

# Summary

U.S. coal production in the week ended April 9, 1988, as estimated by the Energy Information Administration, totaled 17.7 million short tons (bituminous coal and lignite, nearly 17.7 million short tons; Pennsylvania anthracite, .07 million short tons). This was 0.8 percent higher than production in the previous week, and was 6.1 percent higher than production in the corresponding week of 1987.

Between January 1 and April 9, 1988, two States have had significantly higher coal production than in the same period of 1987: Wyoming 15.7 percent (6.1 million short tons) higher and Montana 38.7 percent (3.3 million short tons) higher. These higher levels coincide with widespread sagging coal prices, more spot coal purchases in the region, and higher coal consumption at electric power plants to replace lower hydroelectric

generation due to drought conditions in the West. In addition, coal contracts have been encouraged by actions of the 1987 Montana State Legislature to permit significant graduated reductions in the coal severance tax if 32.2 million short tons of coal are produced in fiscal year 1988 (July 1, 1987, through June 30, 1988).

Cumulative data in Table 1 are presented for the 52-week period ended in the current week. Data for the 52-week period ended in the corresponding week one year earlier are also included.

The methodology used to make weekly estimates of coal production was published in the Weekly Coal Production (DOE/EIA-0218(86/35)), released for publication on September 8, 1986.
